13-OXA PROSTAGLANDINS FOR THE TREATMENT OF GLAUCOMA AND OCULAR HYPERTENSION

BACKGROUND OF THE INVENTION

5 The present invention relates to novel compounds and methods for the treatment of glaucoma and ocular hypertension. In particular, the present invention relates to the use of certain 13-oxa analogs of F, D, and E series prostaglandins to treat glaucoma and ocular hypertension.

10 Glaucoma is a progressive disease which leads to optic nerve damage and, ultimately, total loss of vision. The causes of this disease have been the subject of extensive studies for many years, but are still not fully understood. The principal symptom of and/or risk factor for the disease is elevated intraocular pressure or ocular hypertension due to
15 excess aqueous humor in the anterior chamber of the eye.

The causes of aqueous humor accumulation in the anterior chamber are not fully understood. It is known that elevated intraocular pressure ("IOP") can be at least partially controlled by administering drugs which either reduce the production of aqueous humor
20 within the eye, such as beta-blockers and carbonic anhydrase inhibitors, or increase the outflow of aqueous humor from the eye, such as miotics and sympathomimetics.

Most types of drugs conventionally used to treat glaucoma have potentially serious side effects. Miotics such as pilocarpine can cause blurring of vision and other visual side
25 effects, which may lead either to decreased patient compliance or to termination of therapy. Systemically administered carbonic anhydrase inhibitors can also cause serious side effects such as nausea, dyspepsia, fatigue, and metabolic acidosis, which side effects can affect patient compliance and/or necessitate the termination of treatment. Another
type of drug, beta-blockers, have increasingly become associated with serious pulmonary
30 side effects attributable to their effects on beta-2 receptors in pulmonary tissue. Sympathomimetics, on the other hand, may cause tachycardia, arrhythmia and

hypertension. Recently, certain prostaglandins and prostaglandin derivatives have been described in the art as being useful in reducing intraocular pressure. Typically, however, prostaglandin therapy for the treatment of elevated intraocular pressure is attended by undesirable side-effects, such as irritation and hyperemia of varying severity and duration.

- 5 There is therefore a continuing need for therapies which control elevated intraocular pressure associated with glaucoma without the degree of undesirable side-effects attendant to most conventional therapies.

Prostaglandins are metabolite derivatives of arachidonic acid. Arachidonic acid in the body is converted to prostaglandin G_2 , which is subsequently converted to prostaglandin H_2 . Other naturally occurring prostaglandins are derivatives of prostaglandin H_2 . A number of different types of prostaglandins have been discovered including A, B, D, E, F, G, I and J-Series prostaglandins (EP 0 561 073 A1). Of interest in the present invention are compounds which are believed to exhibit IOP lowering mechanisms similar to those exhibited by PGD_2 (a D-series prostaglandin), $PGF_{2\alpha}$ (an F-series prostaglandin), and PGE_2 (an E-series prostaglandin):

20

The relationship between PGD_2 receptor activation and IOP lowering effects is not well understood. Various publications have reported that PGD_2 receptor activation leads to second messenger activation and in particular, to the stimulation of adenylate cyclase and resultant increases in cAMP levels (Thierauch, *Prostaglandins and their Receptors: II. Receptor Structure and Signal Transduction*, Journal of Hypertension, 12:1-5 (1994)).

25 Regardless of the mechanism, PGD_2 has been shown to lower IOP (Nakajima, *Effects of*

Prostaglandin D₂ and its analogue, BW245C, on Intraocular Pressure in Humans, Graefe's Archive Ophthalmology, 229:411-413 (1991)). Thus, it has been of interest in the ophthalmic field to develop synthetic PGD₂ analogs with IOP lowering efficacy.

5 Synthetic PGD₂-type analogs have been pursued in the art (Nakajima, Goh, Azuma, and Hayaishi, *Effects of prostaglandin D₂ and its analogue, BW245C, on intraocular pressure in humans*, Graefe's Archive Ophthalmology, 229:411-413 (1991)). Though PGD₂-type molecules lower IOP, these types of molecules have also been associated with undesirable side effects resulting from topical ophthalmic dosing. Such
10 effects have included an initial increase in IOP, conjunctival hyperemia, increases in microvascular permeability, and increases in eosinophile infiltration (Alm, *The Potential of Prostaglandin Derivatives in Glaucoma Therapy*, Current Opinion in Ophthalmology, 4(11):44-50 (1993)).

15 Similarly, the relationship of PGF_{2α} receptor activation and IOP lowering effects is not well understood. It is believed that PGF_{2α} receptor activation leads to increased outflow of aqueous humor. Regardless of the mechanism, PGF_{2α} and certain of its analogs have been shown to lower IOP (Giuffre, *The Effects of Prostaglandin F_{2α} the Human Eye*, Graefe's Archive Ophthalmology, 222:139-141 (1985); and Kerstetter et al.,
20 *Prostaglandin F_{2α}-1-Isopropylester Lowers Intraocular Pressure Without Decreasing Aqueous Humor Flow*, American Journal of Ophthalmology, 105:30-34 (1988)). Thus, it has been of interest in the field to develop synthetic PGF_{2α} analogs with IOP lowering efficacy.

25 Synthetic PGF_{2α}-type analogs have been pursued in the art (Graefe's Archive Ophthalmology, 229:411-413 (1991)). Though PGF_{2α}-type molecules lower IOP, a number of these types of molecules have also been associated with undesirable side effects resulting from topical ophthalmic dosing. Such effects include an initial increase in IOP,

breakdown of the blood aqueous barrier and conjunctival hyperemia (Alm, *The Potential of Prostaglandin Derivatives in Glaucoma Therapy*, Current Opinion in Ophthalmology, 4(11):44-50 (1993)).

5 The relationship between EP receptor activation and IOP lowering effects is also not well understood. There are currently four recognized subtypes of the EP receptor: (EP₁, EP₂, EP₃, and EP₄ (Ichikawa, Sugimoto, Negishi, *Molecular aspects of the structures and functions of the prostaglandin E receptors*, J. Lipid Mediators Cell Signaling, 14:83-87 (1996)). It is known in the art that ligands capable of EP₂ receptor
10 activation, such as PGE₂ and synthetic analogs (Fallach, Eliason, *Topical Prostaglandin E₂ Effects on Normal Human Intraocular Pressure* Journal of Ocular Pharmacology, 4(1):13-18 (1988); Woodward, et al., *Molecular Characterization and Ocular Hypotensive Properties of the Prostaglandin EP₂ Receptor* Journal of Ocular Pharmacology and Therapeutics, 11(3):447-454 (1995)), or EP₃ receptor activation (Woodward, et al.,
15 *Intraocular pressure effects of selective prostanoid receptor agonists involve different receptor subtypes according to radioligand binding studies*, Journal of Lipid Mediators, 6:545-553 (1993); Waterbury, et al., *EP₃ but not EP₂ FP or TP Prostanoid-Receptor Stimulation May Reduce Intraocular Pressure*, Investigative Ophthalmology and Visual Science, 31(12):2560-2567 (1990)) lower IOP. However, some of these molecules have
20 also been associated with undesirable side effects resulting from topical ophthalmic dosing, including an initial increase in IOP, photophobia, and eye ache (see, for example, Fallach, Eliason, *Topical Prostaglandin E₂ Effects on Normal Human Intraocular Pressure*, Journal of Ocular Pharmacology, 4(1):13-18 (1988)).

25 Based on the foregoing, a need exists for the development of molecules that may activate the PGD₂, PGF_{2α}, and/or PGE receptors, yielding a more efficacious lowering of IOP, while exhibiting fewer or reduced side effects.

An agent which exhibits comparable or improved efficacy, but with reduced side effects when compared to other agents, is said to have an improved therapeutic profile. It is an object of this invention to provide a class of IOP lowering agents with an improved therapeutic profile over $\text{PGF}_{2\alpha}$, PGD_2 , and PGE_2 and methods of their use. It has now
5 been discovered that the presently claimed 13-oxa analogs of prostaglandins meet this objective. 13-oxa analogs of prostaglandins have been reported in the literature (Collington, EP 0160495 A2, (1985); Mjalli, Roberts, *Synthesis of Some 13-Oxaprostaglandoids*, J. Chem. Soc. Perkin Trans I, 2105-2109 (1989)). The presently
10 claimed compounds, however, and their use in IOP lowering are neither disclosed nor suggested in that art.

SUMMARY OF THE INVENTION

15 The present invention is directed to novel compounds and compositions, and methods of their use in treating glaucoma and ocular hypertension. In particular, the present invention provides certain classes of 13-oxa prostaglandins that may have functional $\text{PGF}_{2\alpha}$, PGD_2 , or PGE receptor agonist activity, and methods of their use in
20 treating glaucoma and ocular hypertension.

The 13-oxa prostaglandins of the present invention may be formulated in various pharmaceutical compositions for administering to humans and other mammals as a treatment of glaucoma or ocular hypertension. As used herein, the term "pharmaceutically effective amount" refers to that amount of a compound of the present invention which lowers IOP when administered to a patient, especially a mammal. The preferred route of administration is topical. The compounds of the present invention can be administered as solutions, suspensions, or emulsions (dispersions) in an ophthalmically acceptable vehicle. As used herein, the term "ophthalmically acceptable vehicle" refers to any substance or combination of substances which are non-reactive with the compounds and suitable for administration to a patient. Solubilizers and stabilizers are deemed to be non-reactive. Preferred are aqueous vehicles suitable for topical application to the patient's eyes.

In forming compositions for topical administration, the compounds of the present invention are generally formulated as between about 0.00003 to about 0.5 percent by weight (wt %) solutions in water at a pH between 4.5 to 8.0, preferably between about 7.0 and 7.5. The compounds are preferably formulated as between about 0.0005 to about 0.07 wt % and, most preferably, between about 0.005 and about 0.05 wt %. While the precise regimen is left to the discretion of the clinician, it is recommended that the resulting solution be topically applied by placing one drop in each eye one or two times a day.

Other ingredients which may be desirable to use in the ophthalmic preparations of the present invention include preservatives, co-solvents, and viscosity building agents.

Antimicrobial Preservatives:

Ophthalmic products are typically packaged in multidose form. Preservatives are thus required to prevent microbial contamination during use. Suitable preservatives include: benzalkonium chloride, thimerosal, chlorobutanol, methyl paraben, propyl paraben, phenylethyl alcohol, edetate disodium, sorbic acid, Onamer M, or other agents known to those skilled in the art. Such preservatives are typically employed at a level between about 0.001% and about 1.0% by weight.

Co-Solvents:

Prostaglandins, and particularly ester derivatives, typically have limited solubility in water and therefore may require a surfactant or other appropriate co-solvent in the composition. Such co-solvents include: Polysorbate 20, 60 and 80; Pluronic F-68, F-84 and P-103; CREMOPHORE® EL (polyoxyl 35 castor oil) cyclodextrin; HCO-40 or other agents known to those skilled in the art. Such co-solvents are typically employed at a level between about 0.01% and about 2% by weight.

Viscosity Agents:

Viscosity greater than that of simple aqueous solutions may be desirable to increase ocular absorption of the active compound, to decrease variability in dispensing

the formulations, to decrease physical separation of components of a suspension or emulsion of formulation and/or otherwise to improve the ophthalmic formulation. Such viscosity building agents include, for example, polyvinyl alcohol, polyvinyl pyrrolidone, methyl cellulose, hydroxy propyl methyl cellulose, hydroxyethyl cellulose, carboxymethyl cellulose, hydroxy propyl cellulose, chondroitin sulfate and salts thereof, hyaluronic acid and salts thereof, and other agents known to those skilled in the art. Such agents are typically employed at a level between about 0.01% and about 2% by weight.

INTERNATIONAL SEARCH REPORT

International application
PCT/US 98/25681

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claims 1 to 12 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
